NEW APPLICATION TRANSMITTAL

Please file the following patent application:

Applicant(s): John E. Larson of P.O. Box 1197, Hamilton MT 59840
For (title): Height Adjustable Furniture Columns Including Actuation Mechanisms

The application consists of: 25 pages of specification, claims, and abstract; a declaration and power of attorney signed by the inventor(s), 16 drawing sheets, and a check for \$434.00 in payment of the filing fee. Also enclosed is a verified statement that this is a filing by a small entity under 37 CFR 1.9 and 1.27.

Respectfully,

Jerry Johnson
Reg. No. 35, 208

enclosures:

Title: Height Adjustable Furniture Column Including
Actuation Mechanism

As a below named inventor, I hereby state that I qualify as an independent inventor as defined in 37 CFR 1.9(c) for purposes of paying reduced fees to the Patent and Trademark Office described in:

- ☐ the specification filed herewith with title as listed above.
☒ the application identified above.
☐ the patent identified above.

I have not assigned, granted, conveyed, or licensed, and am under no obligation under contract or law to assign, grant, convey, or license, any rights in the invention to any person who would not qualify as an independent inventor under 37 CFR 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a nonprofit organization under 37 CFR 1.9(e).

Each person, concern, or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

- ☒ No such person, concern, or organization exists.
☐ Each such person, concern, or organization is listed below.

Separate statements are required from each named person, concern, or organization having rights to the invention stating their status as small entities. (37 CFR 1.27)

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b))

for
Height Adjustable Furniture Columns Including Actuation Mechanisms

BACKGROUND

1 The present application is a continuation-in-part of co-pending U.S. Patent Application
2 serial number 09/173,236 filed 10/15/98 entitled "Height Adjustable Chairs and Tables" by the
3 same inventor as the present application. That application is incorporated herein by this reference.
4 The present application also claims the benefit under 35 U.S.C. 119E of U.S. Provisional Patent
5 Applications serial number 60/091,800 filed 07/06/98 entitled "Height Adjustable Tables", and
6 serial number 60/092,699 filed 07/14/98 entitled "Tube Release Mechanism for Gas or
7 Hydrometallic Springs" by the same inventor as the present application.

8 Height adjustable pedestals are commonly used in chairs in the work place. The height
9 adjustable pedestals which are commonly used in chairs typically use telescoping gas spring
10 mechanisms which assist the user in raising the chair seat to a desirable height. Additionally, the
11 gas spring mechanisms provide a locking mechanism which, until actuated, will temporarily secure
12 the vertical position of the chair seat. Accordingly, the expression "actuation" refers to the
13 unlocking of the spring.

1 Gas springs typically comprise a cylinder, within which a pressurized gas and a gas valve
2 are disposed. A piston is also disposed within the cylinder and is extendible from the cylinder due
3 to the application of pressurized gas on the piston. The actuation of the gas spring involves
4 opening the gas valve by depressing a valve actuation button which is at the top of the gas spring
5 cylinder. Once the button is depressed or actuated, the pressurized gas within the gas spring
6 cylinder is able to move internally within the cylinder through the valve. During the time the
7 spring is actuated the spring is essentially unlocked. The pressurized gas in the actuated cylinder
8 is allowed to pass through the internal valve and apply a downward force on a gas spring piston
9 located within the gas spring cylinder. The distal end of the piston is typically secured proximate
10 to the base of the chair and for this reason, the piston cannot move downwardly. Because of this,
11 the downward force on the piston results in the application of an upward force on the gas spring
12 cylinder. The gas spring cylinder is attached to the chair seat support mechanism. This upward
13 force results in the raising of the chair seat. Similarly, this upward force needs to be overcome by
14 the user to lower the chair seat. This typically involves the actuation of the spring mechanism and
15 the application of a small amount of downward force on the chair seat until the chair seat is in the
16 desired vertical position. At this point, actuation of the spring mechanism is ceased and the spring
17 mechanism locks the vertical position.

18 Height adjustment is increasingly seen as a desirable feature of tables as well. Height
19 adjustable pedestals using a single telescoping gas spring mechanism have been used in height
20 adjustable tables that are typically of a type having a small circular table top. These height
21 adjustable tables are designed as small meeting tables and are of limited use in the modern
22 workplace. Specifically these height adjustable tables do not address the needs of computer users
23 which desire a work desk which is at the proper height. These tables are not able to support the
24 weight of computer equipment, nor are these tables designed to be used as a desk. The available
25 height adjustable tables which use a single gas spring also do not address the needs of disabled
26 workers.

27 Due to perceived difficulties in using more than one telescoping spring mechanism in table
28 pedestals, table manufacturers have typically used electric motors, hydraulics, or hand cranked
29 mechanical lifting mechanisms in height adjustable tables. Tables using any of these three types of

1 lifting mechanisms have proven to be too expensive for widespread acceptance in the
2 marketplace. Tables using hydraulic lifting mechanisms and motor actuated lifting mechanisms
3 also have the disadvantage of extremely high weight which limits their use in modern dynamic
4 work environments.

5 Electric motor use in height adjustable tables, although resulting in heavy and expensive
6 tables, does provide the benefit of allowing the manufacturer to place the switching mechanism at
7 any location on the table. This feature ensures that however the table is used that the switching
8 mechanism for activating the electric motor is properly position for ease of use.

9 Hydraulic lifting mechanisms and hand cranked mechanical lifting mechanisms do not
10 provide flexibility in the placement of the actuation mechanism for the lifting mechanism.
11 Hydraulic table bases require the use of a foot pump pedal at the base of the table proximate to a
12 reservoir of oil. Tables using hand cranked mechanical lifting mechanisms typically require the
13 hand crank lever to be placed on or near the table top where the crank lever may be an
14 obstruction. Hand cranked mechanical lifting mechanisms are also extremely slow at making
15 height adjustments.

16 As a result of the deficiencies noted for existing height adjustable tables and chairs, there is
17 a need for height adjustable tables and chairs which use low cost technologies such as telescoping
18 gas spring mechanisms. There is a need that these telescoping spring mechanisms may be
19 incorporated into telescoping height adjustable columns that are useful in height adjustable
20 pedestals or that may be used as individual telescoping legs. There is a need that these
21 telescoping height adjustable columns use simple lever actuation mechanisms for height
22 adjustment. There is a need that these telescoping height adjustable columns allow a variety of
23 placement locations for lever actuation mechanisms. This would ensure that height adjustable
24 chairs and tables using these telescoping height adjustable columns can accommodate the
25 particular task performed on the chair or table. There is also a need for height adjustable chairs
26 and tables that have high strength and low weight.

27 SUMMARY

28 The present invention relates to height adjustable columns which are typically for use in
29

1 height adjustable tables and chairs. The height adjustable columns of the present invention include
2 telescoping spring mechanisms such as gas springs. The height adjustable columns of the present
3 invention may be incorporated into a height adjustable pedestal for chairs or tables. Alternatively,
4 the height adjustable columns may be used individually as chair or table legs in height adjustable
5 table and chair assemblies.

6 Additionally, the present invention includes different versions of actuation mechanisms
7 which are used to actuate telescoping spring mechanisms used in pedestals, chairs and tables.
8 These actuation mechanisms are typically levers which are incorporated into the height adjustable
9 columns. The actuation mechanisms increase the ease of performing height adjustments. The
10 present invention also includes a particular column structure which may be used to support the
11 actuation mechanisms and that maximizes the benefits provided by these actuation mechanisms.
12 The column structure provides high strength characteristics that are beneficial if used in height
13 adjustable pedestals for chairs or tables. The column structure is also suitable to be used as
14 individual height adjustable legs for chairs or tables.

15 The actuation mechanisms and column structure of the present invention address the
16 deficiencies of existing height adjustable chair pedestals which use a telescoping spring
17 mechanism. These existing versions of actuation mechanisms typically position the actuation lever
18 within the seat support mechanism of the chair. The seat support mechanism is also referred to as
19 the chair control mechanism. Although this placement of the lever is typically used for most chair
20 applications, this placement is not always the most desirable position or the most ergonomic
21 position.

22 Chairs and tables constructed with the height adjustable columns of the present invention
23 may include the actuation lever at a number of positions on the column or columns. These
24 positions include locations on the column both above and below the chair or table base, or on the
25 column proximate to the chair seat support or table top support.

26 The present invention also allows the actuation lever to be incorporated within the chair
27 seat support or table top support. However, as the actuation lever does not need to be
28 incorporated within the chair seat support or table top support, the chair seat supports and table
29 top supports which are usable with the present invention do not need to be manufactured to

1 accommodate an actuation lever or a gas spring socket.

2 The freedom to position the actuation lever provided by the present invention allows for a
3 chair or table to be constructed which is specialized for a particular usage.

4 An example where the present invention is valuable would be height adjustable stools that
5 require height adjustments made by manipulating the actuation lever with the user's feet. In
6 present stools, the actuation lever is either disposed on the chair seat support where only hand
7 manipulation of the lever is possible, or below the stool base where foot manipulation is possible
8 only when the stool seat is low enough for the user to reach the lever at this position immediately
9 above the floor.

10 The present invention allows the lever to be placed above the base in a position where the
11 feet can reach the lever regardless of the height of the stool seat. This is of particular importance
12 to medical stools, and work stools used in a manufacturing setting where the user cannot
13 contaminate their hands such as computer chip manufacturing. Users of drafting stools, and the
14 disabled are also potential beneficiaries of this design.

15 The present invention also allows the actuation lever to be placed at a height where the
16 lever could be manipulated by the users legs. This may be of particular importance in height
17 adjustable tables where use of the hands is restricted.

18 The present invention includes tables that are supported by two or more telescoping gas
19 spring cylinders. The actuation mechanisms which are disclosed allow for the simultaneous as
20 well as non-simultaneous actuation of each of the gas springs used to support the table top.

21 The tables of the present invention include a table top, which may be of a variety of
22 shapes. One version of the height adjustable table includes a table top supporting structure which
23 includes two or more height adjustable legs or stanchions. Each of the legs or stanchions are
24 typically placed underneath the table top at a position between the center of the table top and the
25 side edges of the table top. Each leg or stanchion typically comprises a floor contacting base, a
26 height adjustable column supported on the base, and a table top support supported on the height
27 adjustable column. The height adjustable column of each leg or stanchion comprises at least one
28 lockable telescoping spring assembly, such as a gas spring. The present invention further includes
29 an actuation mechanism which can actuate or unlock each of the lockable telescoping springs

1 simultaneously.

2 The table or chair supporting structure in accordance with the present invention may also
3 comprise four or more individual legs. As in the two legged table, each leg of the table or chair
4 support would include a height adjustable column having a telescoping spring mechanism.

5 Telescoping spring mechanisms which use metal coil springs are also usable in this
6 invention. These springs include oil filled cartridges which have an internal lockable valve and
7 function similarly to the gas spring. An example of this type of spring is shown in U.S. Patent
8 5,078,351 which is incorporated herein by this reference.

10 DRAWINGS

11 FIG. 1 shows a perspective view of a portion of a first version of the height adjustable
12 column used in the present invention.

13 FIG. 2 shows a perspective view of a portion of a second version of the height adjustable
14 column used in the present invention.

15 FIG. 3 shows a perspective view of a portion of a third version of the height adjustable
16 column used in the present invention.

17 FIG. 4A shows a perspective view of a version of a height adjustable table of the present
18 invention.

19 FIG. 4B shows a perspective view of a version of a height adjustable table of the present
20 invention.

21 FIG. 4C shows a perspective view of a version of a height adjustable table of the present
22 invention.

23 FIG. 4D shows a perspective view of a version of a height adjustable table of the present
24 invention.

25 FIG. 5 shows a side view of a version of a height adjustable stool of the present invention.

26 FIG. 6 shows a side view of a version of a height adjustable stool of the present invention.

27 FIG. 7 shows a side view of a version of a height adjustable stool of the present invention.

28 FIG. 8A shows a first side view of a version of a height adjustable column of the present
29 invention.

1 FIG. 8B shows a second side view of the version of a height adjustable column of the
2 present invention shown in FIG. 8A.

3 FIG. 8C shows a side view of a version of a height adjustable column of the present
4 invention.

5 FIG. 9A shows a first side view of a version of a height adjustable column of the present
6 invention.

7 FIG. 9B shows a second side view of a version of a height adjustable table of the present
8 invention.

9 FIG. 9C shows a side view of a stand tube extension for use in the height adjustable
10 column of FIGS. 9A and 9B.

11 FIG. 10 shows a perspective view of a portion of another version of the height adjustable
12 column used in the present invention.

13 FIG. 11A and 11B show side views of a version of the height adjustable column of FIG.
14 10.

15 FIG. 12A show a side view of a height adjustable table.

16 FIG. 12B shows a side view of the height adjustable table of FIG. 12A.

17 DESCRIPTION

18
19 FIG. 1 shows a portion of a first version of the height adjustable column used in the
20 present invention. FIG. 1 is also what is believed to be the simplest application of this version of
21 the invention. This figure shows how a locking telescoping spring mechanisms 10 which is
22 secured within a furniture component support 20 can be actuated, or unlocked, by a dual pivoting
23 actuation lever 100 which in this example is disposed within the furniture component support.

24 In detail, the figure shows the top portion of a locking telescoping spring mechanism 10
25 which is disposed in a socket 22 of the furniture component support 20. This top portion of the
26 locking telescoping spring mechanism would typically be the top of the cylinder portion of a gas
27 spring. An actuation button 12 is disposed on the top of a locking telescoping spring mechanism
28 which extends into the interior of the furniture component support 20. Should the locking
29 telescoping spring mechanism 10 shown in the figure be a gas spring, then the actuation button 12

1 is an extension of a gas flow control valve which is disposed within the gas spring cylinder. If the
2 locking telescoping spring mechanism includes a metal coil spring, then the actuation button is an
3 extension of a fluid flow control valve which is typically disposed within a cartridge which is
4 disposed within the cylinder of the mechanism and is surrounded by the metal coil. An example of
5 this type of spring is shown in U.S. Patent 5,078,351 which is incorporated herein by this
6 reference. Depressing the actuation button in either case results in the opening of an internal
7 valve which allows the telescoping spring mechanism to either be compressed or allowed to
8 extend. Specifically, the locking telescoping spring mechanism is actuated, or unlocked, when the
9 actuation button is depressed.

10 A first elongated opening 24 is disposed in a first substantially upright wall 25 of the
11 furniture component support 20. Similarly, a second elongated opening 26 is disposed in a
12 second substantially upright wall 27 of the furniture component support. The upright walls 25
13 and 27 are disposed on opposite sides of the actuation button 12.

14 The actuation lever 100 is shown having three sections. A first lever section 102 is
15 disposed outside the first upright wall 25. The first lever section includes a distal end 104, and a
16 proximate end 106, relative to the first upright wall 25. A second actuation lever section 108
17 extends from the interior of the opening 24 of the first upright wall to the opening 26 of the
18 second upright wall 27. The second actuation section 108 includes a first end 110 disposed within
19 the opening 24 and a second end 112 disposed within the opening 26. The actuation lever second
20 section 108 further includes a middle section 114 which is disposed immediately above the
21 actuation button 112. An actuation lever third section 116 is disposed outside the second upright
22 wall 27. The actuation lever third section includes a distal end 118 and a proximate end 120,
23 relative to the second upright wall 27.

24 To actuate, or unlock, the telescoping spring mechanism either the actuation lever first or
25 third sections can be pivoted upward or downward. If the first lever section 102 is pivoted
26 upward, the top surface 28 of the elongated opening 24 acts as a fulcrum. As the lever first
27 section distal end 104 is moved upward, the actuation lever on the opposite side of the fulcrum 28
28 angles downward. This downward movement of the actuation lever second and third sections
29 results in the middle section 114 of the lever second section depressing the actuation button 112

1 and unlocking the spring mechanism.

2 Pressing downward on the distal end 104 of the actuation lever first section results in the
3 actuation lever pivoting about a fulcrum surface 30 disposed at the top of the second opening 26.
4 This movement of the actuation lever first section also caused the middle section 114 of the lever
5 second section to depress the actuation button. Again, while the actuation button is depressed,
6 the entire mechanism is unlocked, and the spring within the mechanism may be compressed or
7 allowed to resiliently expand.

8 The actuation lever third section 116 can be pivoted in the same manner as the first lever
9 section. As the actuation lever is pivoting about the fulcrum surfaces at the top of the elongated
10 openings, it is desirable to place the lever in contact with the fulcrum surfaces when the actuation
11 mechanism is assembled within the furniture component support.

12 FIG. 2 shows how two retaining collars can be disposed on the actuation lever. The
13 retaining collars are one of many ways that the lever can be retained within the height adjustable
14 column.

15 FIG. 3 shows how a second actuation lever 130 which is disposed orthogonally to the first
16 lever section, can be incorporated into the actuation mechanism of this version of the height
17 adjustable column of the present invention. In this version of the invention, the second actuation
18 lever 130 of the actuation mechanism is disposed in the same plane as the first lever 100. The
19 second actuation lever 130 includes first, second and third lever sections 132, 134, and 136. The
20 lever first section 132 is disposed outside of an elongated opening 32 formed in third substantially
21 upright wall 33. The lever second section 134 is disposed from the inside of the opening 32 to the
22 inside of the opening 34 disposed in a fourth substantially upright wall 35. The lever third section
23 136 is disposed outside the opening 34 of the fourth substantially upright wall 35.

24 The opening 32 includes a fulcrum surface 36. The opening 34, includes a fulcrum surface
25 38. The second actuation lever pivots about the fulcrum surfaces in exactly the same manner as
26 was described for the first actuation lever 100. Again, it is desirable to place the lever in contact
27 with the fulcrum surfaces when the actuation mechanism is assembled within the furniture
28 component support. This ensures that the lever will pivot about the fulcrum surfaces and will not
29 pivot about the actuation button.

FIG. 3 also shows a ring connector which connects the distal ends of the first and second actuation levers. The ring connector allows a user to actuate, or unlock, the telescoping spring mechanism by pivoting the ring upward or downward at any location on the ring. Regardless of the location on the ring which is moved upward or downward, the movement of the ring will result in the depressing of the actuation button.

In an exploded view, FIG. 4A shows how two height adjustable legs or stanchions, each of which include a height adjustable column, are able to support a table top. A first leg or stanchion for supporting the table top comprises a base section 402, a gas spring 406, a stand tube 408, and a table top support 414. The stand tube bottom 410 is shown tapered and is also shown exploded above a socket 404 of the base section within which the stand tube would be disposed. The top of the telescoping spring mechanism, which in this case is the cylinder of the mechanism, is shown extending from a top opening 409 within the stand tube 408. As was the case in FIGS. 1 through 3, the table top support includes a socket to receive the top of the cylinder of the telescoping spring mechanism.

An actuation lever first section 421 is shown extending from an elongated opening 418 within a first substantially upright surface 416 of the table top support 414. An actuation lever third section 422 is shown extending out the opposite side of the table top support.

A second stanchion or leg which includes base 432, gas spring 436, stand tube 438, table top support 444, and actuation lever 450 is essentially identical to the first stanchion or leg.

The height adjustable table of FIG. 4A also shows connecting elements 454 and 456 which connect the distal ends of the actuation levers 420 and 450. In use, a height adjustment could be made by the user accessing the first connecting element 454 through the access holes 462 and 464 and either pressing upward or downward on the connecting rod 454. By pressing upward or downward on the connecting rod 454, the actuation levers 420 and 450 are both pivoted causing both actuation levers to contact the actuation buttons beneath each actuation lever to be depressed. This results in the actuation, or unlocking, of both of the telescoping spring mechanisms 406 and 436 simultaneously. Similarly, the user could access the second connecting member 456 through the access holes 466 and 468. The second connecting member could also be pressed upward or downward resulting in the simultaneous actuation of both of the telescoping

1 spring mechanisms 406 and 436.

2 It is understood that the actuation levers 420 and 450 and the connecting members 454
3 and 456 could be extended to the perimeter of the table. This would allow a user to maintain a
4 secure hold on the edge of the table during height adjustments. This would also allow for the
5 removal of the access holes 462 and 464, and 466 and 468 which may not meet the appearance
6 requirements of some users.

7 Although the connecting members are beneficial in transferring the downward or upward
8 lever movements, it is understood that the connecting elements could be removed which would
9 require the user to actuate each locking telescoping spring mechanism independently. This is the
10 version of the invention shown in FIG. 4C. Accordingly, the user would actuate the locking
11 telescoping spring mechanisms by either pivoting the first or third lever section of each actuation
12 lever upward or downward. It is also understood that an actuation mechanism such as was shown
13 in FIG. 3 could be used with each leg or stanchion. Use of this double lever and ring actuation
14 mechanism within a table having two legs would be similar to the description provided for FIG. 3
15 with the exception that both actuation mechanisms would need to be actuated to adjust the table
16 top height. It is also possible to use the version of the invention shown in FIG. 4A in a table
17 supporting structure having four independent legs, with each leg comprising a height adjustable
18 column. An example of this would be to attach two additional levers to the connecting member
19 456 with the two additional levers extending in the opposite direction at the levers 420 and 450.
20 These two additional levers would actuate two additional locking telescoping spring mechanisms
21 of two additional legs which support the table. In a four legged table of this type the base
22 sections could be removed, if desired. This is just one example of using the invention with more
23 than two legs.

24 In an exploded view, FIG. 4B shows another version of the invention which includes two
25 height adjustable legs or stanchions which support a table top. Each of the height adjustable legs
26 or stanchions include a height adjustable column. In this version, the connecting member 456B
27 has been moved closer to the table top supports 414B and 444B. Extending from the connecting
28 member are knob extensions 474B and 475B (not shown). The knob extensions extend through
29 holes 470B and 476B that are disposed within the table top. Knobs 472B and 478B are shown

1 exploded above the holes. The knobs are attached to the knob extensions.

2 In use the knobs provide a conveniently located surface on which the hands of the user
3 will press to lower the table. The knobs also provide an ergonomic handle which the hands of the
4 user can grab and lightly pull upwardly to cause the table to rise. The knobs are located close to
5 the center of the table to minimize the application of a force which might cause the telescoping
6 spring mechanisms to bind during height adjustments. Other placement for the knobs on the table
7 are also possible, as well.

8 FIG. 4C shows how individually actuated locking telescoping spring mechanism can be
9 used in height adjustable columns used to support a table top. Each of the levers 420C and 450C
10 would be accessed through the access holes. Both levers would have to both be pivoted to
11 actuate the spring mechanisms, as no connecting member is provide to transfer the movement
12 from one lever to the other as was the case in FIGS. 4A and 4B. A double lever or double lever
13 and ring actuation mechanism could also have been used as has been described earlier.

14 FIG. 4D shows the inclusion of structural connectors 480, 482 and 484 which may be
15 used to add strength to the base, telescoping spring and stand tube assembly, and table support of
16 the invention. These structural connectors may not be necessary in many instances, but should the
17 need for higher strength arise, the invention will easily accommodate such requirements.

18 FIG. 5 shows another version of the invention. In this version, the double lever and ring
19 actuation are supported on a top tube of a height adjustable column. FIG. 5 is a side view of a
20 height adjustable stool which includes a height adjustable column of the present invention. The
21 version of the height adjustable column shown in FIG. 5 is different from that of the previous
22 versions shown in FIGS. 1 through 4 in that top and bottom telescoping tubes are used within the
23 height adjustable column. As will be seen, the use of telescoping tubes within the height
24 adjustable column allows for a variety of actuation lever placement locations. The telescoping
25 tubes also provide a higher degree of strength to the column.

26 Specifically, FIG. 5 shows a height adjustable stool having a base 502 which includes a
27 center socket 504. A locking telescoping spring mechanism, which includes a cylinder 506 and a
28 piston 507, are supported by a stand tube 508. The stand tube 508 comprises the bottom
29 telescoping tube of the column and includes a top opening 509 which provides a support surface

1 for the cylinder 506 which moves vertically within the opening 509. The stand tube also includes
2 a tapered bottom end 510 which fits into the base center socket. A top tube 514 telescopes over
3 the stand tube 508. The top tube 514 includes an internal support surface 516, which in this
4 version includes a tapered socket sized to receive the tapered top portion of the telescoping spring
5 cylinder.

6 The spring actuation button 512 extends within the interior of the top tube to a position
7 above the support surface 516. The actuation mechanism is shown immediately above the
8 actuation button. Part of the actuation mechanism is broken away to aid in viewing the
9 interaction of the actuation mechanism of the actuation mechanism with the top tube and the
10 actuation button. The actuation mechanism is similar to the mechanism which was previously
11 shown and described in FIG. 3. The actuation mechanism includes a first lever that includes a first
12 section 530, a second section 532, and a third section 534. A second lever which is orthogonally
13 disposed relative to the first lever has been removed due to the cross sectioning of the invention
14 within this drawing. A ring 536 is partially shown which connects the distal ends of the two
15 orthogonally disposed levers.

16 The first actuation lever second section 532 is disposed within the interior of the top tube
17 and is shown extending from the top of an elongated opening 522 within a first substantially
18 upright surface within the upright cylindrical wall of the top tube 514, to the top of an elongated
19 opening 524 within a second substantially upright surface within the upright cylindrical wall of the
20 top tube 514. The second actuation lever which is not shown in this figure would extend between
21 similar elongated openings within the cylindrical wall of the top tube.

22 The top of the elongated openings 522 and 524 form fulcrum surfaces on which the levers
23 pivot as was previously described in FIGS. 1 through 3. The pivoting of the actuation
24 mechanism, either upward or downward, results in the depressing of the actuation button 512 on
25 the top of the locking telescoping spring mechanism. Once the actuation button is depressed the
26 telescoping spring mechanism is unlocked. The spring, which is disposed within the cylinder of
27 the mechanism, may be compressed or may be allowed to resiliently expand when in this actuated,
28 or unlocked, condition. Compressing the spring results in the cylinder of the telescoping spring
29 mechanism to telescope onto the piston. Resilient expansion of the spring results in the cylinder

1 telescoping away from the piston. Once a height adjustment is made the actuation mechanism is
2 released and the internal valve within the spring mechanism will close, thus locking the mechanism
3 in that position.

4 A seat support plate 518 is supported by the top tube 514. A seat cushion 520 is similarly
5 supported by the seat support plate 518. It is understood that many different types of seat
6 support mechanisms, such as those incorporating tilt mechanisms, back rest mechanisms, etc.,
7 would be usable with stool. It is also understood that the seat cushion could be replaced with a
8 table top.

9 FIG. 6 shows the height adjustable column of FIG. 5 in an inverted condition. The stand
10 tube 608 is shown attached to the seat support plate 618. The bottom tube 614 is shown attached
11 to the base 602 at the center socket 604 of the base. The telescoping spring support 616 in this
12 version comprises a simple plate having a center opening through which the actuation button 612
13 extends.

14 An actuation lever is shown disposed within openings 622 and 624. The lever second
15 section 632 contacts the bottom of elongated openings 622 and 624 ensuring that the lever will
16 pivot on the fulcrum surfaces provided by the bottom surfaces of the elongated openings 622 and
17 624. The ring 636 has been partially broken out in the drawing so as to not prevent the drawing
18 from showing the interaction of the actuation lever with the elongated openings and the actuation
19 button. A second actuation lever orthogonally disposed relative to the first lever has been broken
20 out from the drawing for the same purpose.

21 The actuation of the telescoping spring mechanism is identical to the actuation of the
22 mechanism as was described for FIG. 5. However, with the placement of the actuation
23 mechanism proximate to the chair base, the feet of the user would typically be used to manipulate
24 the actuation ring.

25 FIG. 7 shows a version of the height adjustable column which is very similar to the column
26 of FIG. 6. The bottom tube in this version extends completely through the base center socket.
27 The elongated openings which are disposed in the bottom tube cylindrical wall, and through which
28 the actuation levers extend, include a bottom surface which is formed by an end cap. The end cap
29 supports the actuation levers within the elongated openings and provides the fulcrum surface at

1 the bottom of the elongated openings on which the levers pivot. As is shown in FIGS. 7a, 7b, and
2 7c, the end cap (717A, 717B, and 717C) can be attached to the bottom tube through the use of
3 vertical or horizontal fasteners, or by welding the end cap to the bottom tube.

4 The use of the actuation mechanism of FIG. 7 is similar to the previous versions which use
5 a ring actuation mechanism. It is understood that although the stools of FIGS. 5, 6, and 7 which
6 are shown using a ring actuation mechanism, a single or double lever actuation mechanism as has
7 also previously been described could also have been used.

8 FIG. 7 also show how a second actuation ring 764 can be supported by vertical members
9 760 and 762 and a horizontal member 766. This second actuation ring allows the user to actuate
10 the telescoping spring mechanism for height adjustments when the seat is at the highest setting
11 which results in the user being unable to contact the actuation ring 736.

12 FIGS. 8A and 8B show a height adjustable column that includes an actuation lever that
13 uses a cam disposed on the lever. The cam is used to depress the actuation button of the locking
14 telescoping spring mechanism.

15 The height adjustable column is supported on a base 802 which is shown partially broken
16 away. The height adjustable column includes a locking telescoping spring mechanism which
17 includes a cylinder 806, a piston 807 extending downward from the cylinder, and an actuation
18 button 812. The locking telescoping spring mechanism is supported by a stand tube 808. The
19 cylinder is movably supported within an opening 809 in the top of the stand tube. The stand tube
20 is supported by a bottom tube 814. A top tube 815 telescopes over the bottom tube. The top
21 tube includes a telescoping spring mechanism support surface 816 which has a center opening
22 through which the actuation button extends. A table top or chair seat support plate 818 is
23 supported on top of the top tube 815.

24 An actuation lever 830 is shown supported by the top tube. The actuation lever 830
25 includes a first handle section 832 and a second section 834. An eccentrically disposed cam lobe
26 836 is included on the center of the lever second section. The second section is shown supported
27 at two positions on the cylindrical wall of the top tube 815 at the locations where the actuation
28 lever passes through the cylindrical wall. Retaining collars 836 and 840 maintain the position of
29 the cam lobe immediately above the actuation button 812.

1 Rotation of the lever first section 832 in either a clockwise or counter-clockwise direction
2 results in the eccentric cam lobe 836 depressing the actuation button. FIG. 8B shows the
3 eccentric cam lobe 836 from the side a side view. The lever is disposed immediately above the
4 actuation button, and continuously contacts the actuation button throughout the rotation of the
5 lever. The cam lobes depress the actuation button as the lever is rotated. Although the lever is
6 shown supported at two positions on the cylindrical wall of the top tube 815, it is understood that
7 the cam actuation lever as is shown if FIGS. 8A and 8B requires a single surface for support.

8 FIG. 8C shows a modified version of the height adjustable column of FIGS. 8A and 8B.
9 The actuation lever 830C in FIG. 8C is shown extending between elongated openings 822C and
10 824C within the cylindrical wall of the top tube 815C. The actuation lever second section 834C is
11 disposed such that the lever is contacting the top of the elongated openings 822C and 824C, while
12 maintaining a position immediately above the actuation button 812C. Accordingly, the actuation
13 lever can be either rotated in either direction or pivoted upward or downward. The top of the
14 elongated openings provide a fulcrum surface as was the case in the previous versions of the
15 invention. This placement at the top of the elongated openings 822C and 824C ensures that the
16 actuation lever will pivot about the fulcrum surfaces and will not pivot about the actuation button.
17 Although not shown, it is understood that the combination of a cam lobe and dual pivoting lever,
18 as is shown in FIG. 8C, could have used in any of the previous versions of the invention. The
19 inclusion of a cam lobe on the center section of the actuation levers would provide the actuation
20 mechanisms the additional actuation mode of rotational actuation.

21 FIGS. 9A, 9B, and 9C are drawn to another version of a dual pivoting actuation
22 mechanism for a height adjustable column. FIG. 9A shows a locking telescoping spring
23 mechanism which comprises a cylinder 906, a piston 907 and an actuation button 912. The
24 locking telescoping spring mechanism is supported by a stand tube 908. The cylinder is movably
25 supported within an opening 909 at the top of the stand tube 908. An actuation lever 930 is
26 shown extending through the upper portion of the cylinder. As FIG. 9B shows, actuation lever
27 930 is extends through elongated openings 922 and 924 that are disposed in the upper portion of
28 the cylinder. The lever 930 is shown contacting a top fulcrum surface 923 of the opening 922 in
29 FIG. 9B. The top of elongated openings 922 and 924 provide the fulcrum surfaces for the

1 pivoting actuation lever 930 which may be pivoted upward or downward. The lever second
2 section will depress the actuation button 912 if the lever 930 is pivoted upward or downward.

3 FIG. 9C shows a stand tube extension which may be used to elevate the stand tube in
4 height adjustable columns.

5 FIG. 10 shows a modified version of the actuation mechanism of FIG. 3. In this version, a
6 first bottom actuation lever 1100 is overlapped by a second top actuation lever 1140 which is
7 disposed immediately above the bottom lever. The bottom or first lever includes a first section
8 1102, a second section 1104, and a third section 1106. The bottom lever second section extends
9 between elongated openings 1122 and 1126 which are disposed in a first wall section 1121 and a
10 second wall section 1125 respectively. The bottom lever is disposed so the second section
11 contacts the top fulcrum surfaces 1124 and 1128 of the elongated openings, while the lever
12 contacts the actuation button.

13 The top or second actuation lever 1140 includes a first section 1142, a second section
14 1144, and a third section 1146. The top lever second section extends between elongated
15 openings 1132 and 1136 which are disposed in third and fourth walls 1133 and 1135 respectively.
16 The top lever is disposed so that the second section contacts the top fulcrum surfaces 1134 and
17 1138 of the elongated openings 1132 and 1136. The bottom of the top lever second section
18 contacts the top of the bottom lever second section. The elongated openings 1132 and 1136 are
19 disposed at an elevation above the elongated openings 1122 and 1126.

20 In use either of the lever can be pivoted upward or downward as was the case for the
21 mechanism of FIG. 3. However, as the top or second lever is supported on the bottom or first
22 lever, the pivoting of the top lever 1140 will result in the second section of the top lever pushing
23 downward on the second section of the bottom lever. This causes the second section of the
24 bottom lever to depress the actuation button 1112.

25 FIGS. 11A and 11B show how the two actuation lever second sections can be
26 manufactured so that the levers engage each other in a specific manner that allows either lever to
27 depress the actuation button if rotated. This rotational actuation is in addition to the dual pivoting
28 actuation as was shown in FIG. 10. The engagement of the levers also provides a retention
29 system for the levers and provides for easy assembly of the mechanism.

1 The bottom lever 1204 as is shown in FIG. 11A includes a center portion 1245 from
2 which a portion of the outside diameter of the lever has been removed. Adjacent to the center
3 portion 1245 are cam lobes 1207 and 1209 which are of a larger diameter, and will depress the
4 actuation button 1212 if the lever is rotated clockwise or counter clock wise.

5 The bottom lever also includes a reduced diameter section on the top of the center portion
6 1211 for interaction with the top lever.

7 As is shown in FIG. 11B, the top lever also includes a center portion 1245 of reduced
8 diameter which rests in the recess 1211 of the first lever. Upon rotation of the second lever, one
9 of the two cam lobes 1247 and 1249, which are adjacent to the center portion , will press
10 downward on the first lever and cause the first lever to depress the actuation button 1212.

11 FIGS. 12A and 12B show a four legged table where each leg comprises a height
12 adjustable column. For simplicity, a single dual pivoting actuation lever is disposed on each
13 height adjustable column. The levers are shown at 1202, 1204, 1206, and 1208. A perimeter
14 connector 1210 connects the four levers. Two knobs 1212 and 1214 are attached to the
15 perimeter connector. When both knobs are lifted, the perimeter connector is lifted which pivots
16 the four levers and actuates the locking telescoping spring mechanism of each leg. This allows the
17 table to be raised. Similarly, when both knobs are depressed, all four locking telescoping spring
18 mechanisms are actuated and the table top can be lowered.

19 Additionally, a cable actuation mechanism is shown which includes four actuation cables
20 1220, 1222, 1224, and 1226, which are each attached to a single actuation lever. The actuation
21 cables pass through housings 1221, 1223, 1225, and 1227 respectively. A handle 1228 is
22 attached to each cable and will pull each cable equally, and simultaneously, thus actuation the
23 locking telescoping spring mechanism of each leg.

24 It is understood that various modifications and changes in form or detail could readily be
25 made without departing from the spirit of the invention. Many of such modifications have been
26 previously mentioned within the description of the invention. It is therefore intended that the
27 invention be not limited to the exact form and detail herein shown and described, nor to anything
28 less than the whole of the invention herein disclosed and as hereinafter claimed.

1 I CLAIM:

2 1. A height adjustable supporting structure for furniture components comprising:
3 at least one leg, wherein the at least one leg comprises:
4 a floor contacting base, and a height adjustable column disposed on the base,
5 wherein the height adjustable column comprises a locking telescoping spring mechanism,
6 the telescoping spring mechanism including a valve actuation button that extends outwardly from
7 the mechanism,

8 wherein the height adjustable column includes at least first and second substantially
9 upright opposing surfaces, wherein the first and second substantially upright opposing surfaces
10 are disposed at substantially the vertical position of the valve actuation button on the telescoping
11 spring mechanism, wherein the first and second substantially upright opposing surfaces each
12 include an inside surface which faces the valve actuation button, and an outside surface facing
13 away from the valve actuation button; the first and second upright surfaces each including an
14 enlarged opening;

15 an actuation lever disposed on the height adjustable column and including a first handle
16 section disposed outside the first substantially upright surface, and a second section disposed
17 between the first and second upright surfaces and extending from the opening of the first
18 substantially upright surface to the opening within the second substantially upright surface;
19 wherein the openings of the first and second substantially vertical surfaces each include a fulcrum
20 bearing surface on which the second section of the lever may pivot;

21 and wherein the second section of the actuation lever is disposed adjacent to the valve
22 actuation lever, wherein pivoting of the lever on the fulcrum bearing surface of the first or second
23 substantially upright surfaces will result in the second section of the actuation lever engaging and
24 depressing the valve actuation lever.

25
26 2. The height adjustable supporting structure of claim 1, wherein the telescoping spring
27 mechanism includes a cylinder section and a piston section.

28
29 3. The height adjustable supporting structure of claim 2, wherein the height adjustable column

1 further includes a stand tube; and wherein the stand tube includes an opening on one end; wherein
2 the cylinder of the telescoping spring may move vertically within the opening of the stand tube.
3

4 4. The height adjustable supporting structure of claim 1, wherein the height adjustable column
5 includes a bottom tube and a top tube which is disposed in a telescoping arrangement with the
6 bottom tube; and

7 wherein the locking telescoping spring mechanism is disposed within the top and bottom
8 tubes.
9

10 5. The height adjustable supporting structure of claim 4, wherein the top tube includes the first
11 and second substantially upright surfaces.
12

13 6. The height adjustable supporting structure of claim 5, wherein the top tube further includes a
14 telescoping spring mechanism support surface, wherein the telescoping spring is attached to the
15 telescoping spring mechanism support surface; and wherein the telescoping spring mechanism,
16 when actuated, pushes against the telescoping spring mechanism support surface.
17

18 7. The height adjustable supporting structure of claim 4, wherein the bottom tube includes the
19 first and second substantially upright surfaces.
20

21 8. The height adjustable supporting structure of claim 7, wherein the bottom tube further includes
22 a telescoping spring mechanism support surface, wherein the telescoping spring is attached to the
23 telescoping spring mechanism support surface; and wherein the telescoping spring mechanism,
24 when actuated, pushes against the telescoping spring mechanism support surface.
25

26 9. The height adjustable supporting structure of claim 4, further including a furniture component
27 support, and wherein the top telescoping tube is attached to the furniture component support and
28 depends downwardly therefrom.
29

1 10. The height adjustable supporting structure of claim 3, further including a furniture component
2 support, and wherein the stand tube is attached to the furniture component support surface and
3 depends downwardly therefrom.

4
5 11. The height adjustable supporting structure of claim 1, further including a third lever section
6 extending outwardly from the second substantially upright surface.

7
8 12. The height adjustable supporting structure of claim 11, further including a third and fourth
9 substantially upright surfaces, the third and fourth substantially upright surfaces including an
10 enlarged opening therein, the third and fourth substantially upright surfaces disposed at
11 substantially the same vertical position as the first and second substantially upright surfaces; and
12 further including a second actuation lever disposed on the height adjustable column;
13 wherein the second actuation lever includes a first handle section disposed outside the third
14 substantially upright surface, and a second section disposed between the first and second upright
15 surfaces and extending from the opening of the first substantially upright surface to the opening
16 within the second substantially upright surface; wherein the openings of the first and second
17 substantially vertical surfaces each include a fulcrum bearing surface on which the second section
18 of the lever may pivot;

19 and wherein the second section of the actuation lever is disposed adjacent to the valve
20 actuation lever, wherein pivoting of the lever on the fulcrum bearing surface of the first or second
21 substantially upright surfaces will result in the second section of the actuation lever engaging and
22 depressing the valve actuation lever.

23
24 13. The height adjustable supporting structure of claim 12, wherein the second actuation lever is
25 disposed at a different elevation than the first actuation lever.

26
27 14. A height adjustable supporting structure for furniture components comprising:
28 at least one leg, wherein the at least one leg comprises:
29 a floor contacting base, and a height adjustable column disposed on the base,

1 wherein the height adjustable column comprises a locking telescoping spring mechanism,
2 the telescoping spring mechanism including a valve actuation button that extends outwardly from
3 the mechanism,

4 the height adjustable column further including means for supporting an actuation lever;
5 an actuation lever disposed on the height adjustable column and including a first handle
6 section disposed outside the means for supporting an actuation lever, and a second section
7 disposed between the means for supporting an actuation lever and the valve actuation button;
8 wherein the means for supporting an actuation lever includes a bearing surface on which the
9 second section of the lever may rotate;

10 and wherein the second section of the lever includes a cam lobe eccentrically disposed on
11 the second section of the lever adjacent to the valve actuation lever;

12 wherein rotating the lever in the bearing surface of the means for supporting an actuation
13 lever will result in the cam lobe of the second section of the actuation lever engaging and
14 depressing the valve actuation lever.

15
16 15. The height adjustable supporting structure of claim 14, wherein the means for supporting an
17 actuation lever comprises a first substantially upright surface.

18
19 16. The height adjustable supporting structure of claim 14, wherein the telescoping spring
20 mechanism includes a cylinder section and a piston section.

21
22 17. The height adjustable supporting structure of claim 16, wherein the height adjustable column
23 further includes a stand tube; and wherein the stand tube includes an opening on one end; wherein
24 the cylinder of the telescoping spring may move vertically within the opening of the stand tube.

25
26 18. The height adjustable supporting structure of claim 14, wherein the height adjustable column
27 includes a bottom tube and a top tube which is disposed in a telescoping arrangement with the
28 bottom tube; and wherein the locking telescoping spring mechanism is disposed within the top and
29 bottom tubes.

1 19. The height adjustable supporting structure of claim 18, wherein the top tube includes the first
2 substantially upright surface.

3
4 20. The height adjustable supporting structure of claim 19, wherein the top tube further includes
5 a telescoping spring mechanism support surface, wherein the telescoping spring is attached to the
6 telescoping spring mechanism support surface; and wherein the telescoping spring mechanism,
7 when actuated, pushes against the telescoping spring mechanism support surface.

8
9 21. The height adjustable supporting structure of claim 18, wherein the bottom tube includes the
10 first substantially upright surface.

11
12 22. The height adjustable supporting structure of claim 21, wherein the bottom tube further
13 includes a telescoping spring mechanism support surface, wherein the telescoping spring is
14 attached to the telescoping spring mechanism support surface; and wherein the telescoping spring
15 mechanism, when actuated, pushes against the telescoping spring mechanism support surface.

16
17 23. The height adjustable supporting structure of claim 18, further including a furniture
18 component support, and wherein the top telescoping tube is attached to the furniture component
19 support and depends downwardly therefrom.

20
21 24. The height adjustable supporting structure of claim 17, further including a furniture
22 component support, and wherein the stand tube is attached to the furniture component support
23 surface and depends downwardly therefrom.

24
25 25. The height adjustable supporting structure of claim 14, further including a second
26 substantially upright surface; and a third lever section extending outwardly from the second
27 substantially upright surface; and wherein the second section is disposed between the first and
28 second upright surfaces and extending from the opening of the first substantially upright surface
29 to the opening within the second substantially upright surface; wherein the openings of the first

1 and second substantially vertical surfaces are enlarged and each include a fulcrum bearing surface
2 on which the second section of the lever may pivot;

3 and wherein the second section of the actuation lever is disposed adjacent to the valve
4 actuation lever, wherein pivoting of the lever on the fulcrum bearing surface of the first or second
5 substantially upright surfaces will result in the second section of the actuation lever engaging and
6 depressing the valve actuation lever.

7
8 26. The height adjustable supporting structure of claim 25, further including a third and fourth
9 substantially upright surfaces, the third and fourth substantially upright surfaces including an
10 enlarged opening therein, the third and fourth substantially upright surfaces disposed at
11 substantially the same vertical position as the first and second substantially upright surfaces; and

12 further including a second actuation lever disposed on the height adjustable column;
13 wherein the second actuation lever includes a first handle section disposed outside the third
14 substantially upright surface, and a second section disposed between the third and fourth upright
15 surfaces and extending from the opening of the third substantially upright surface to the opening
16 within the fourth substantially upright surface; wherein the openings of the third and fourth
17 substantially vertical surfaces each include a fulcrum bearing surface on which the second section
18 of the lever may pivot;

19 and wherein the second section of the actuation lever is disposed adjacent to the valve
20 actuation lever, wherein pivoting of the lever on the fulcrum bearing surface of the third or fourth
21 substantially upright surfaces will result in the second section of the actuation lever engaging and
22 depressing the valve actuation lever.

ABSTRACT

A height adjustable supporting structure for furniture components comprises at least one height adjustable leg. Each leg includes a height adjustable column that includes a locking telescoping spring mechanism. The locking telescoping spring mechanism includes a valve actuation button that extends outwardly from the mechanism. The height adjustable column further includes at least first and second substantially upright opposing surfaces disposed at substantially the vertical position of the valve actuation button on the telescoping spring mechanism. The first and second upright surfaces each including an enlarged opening. An actuation lever is disposed on the height adjustable column and includes a first handle section disposed outside the first substantially upright surface, and a second section disposed between the first and second upright surfaces and extending from the opening of the first substantially upright surface to the opening within the second substantially upright surface. The enlarged openings of the first and second substantially vertical surfaces each include a fulcrum bearing surface on which the second section of the lever may pivot. The second section of the actuation lever is disposed adjacent to the valve actuation lever. Pivoting of the lever on the fulcrum bearing surface of the first or second substantially upright surfaces will result in the second section of the actuation lever engaging and depressing the valve actuation lever.

FIG. 1 is a perspective view of a mechanical assembly 10, including a base 12, a shaft 14, a housing 16, a cover 18, a bearing 20, a pulley 22, a belt 24, a motor 26, a drive shaft 28, a gear 30, a pinion 32, a worm 34, a worm gear 36, a shaft 38, a pulley 40, a belt 42, a motor 44, a drive shaft 46, a gear 48, a pinion 50, a worm 52, a worm gear 54, a shaft 56, a pulley 58, a belt 60, a motor 62, a drive shaft 64, a gear 66, a pinion 68, a worm 70, a worm gear 72, a shaft 74, a pulley 76, a belt 78, a motor 80, a drive shaft 82, a gear 84, a pinion 86, a worm 88, a worm gear 90, a shaft 92, a pulley 94, a belt 96, a motor 98, a drive shaft 100, a gear 102, a pinion 104, a worm 106, a worm gear 108, a shaft 110, a pulley 112, a belt 114, a motor 116, a drive shaft 118, a gear 120, a pinion 122, a worm 124, a worm gear 126, a shaft 128, a pulley 130, a belt 132, a motor 134, a drive shaft 136, a gear 138, a pinion 140, a worm 142, a worm gear 144, a shaft 146, a pulley 148, a belt 150, a motor 152, a drive shaft 154, a gear 156, a pinion 158, a worm 160, a worm gear 162, a shaft 164, a pulley 166, a belt 168, a motor 170, a drive shaft 172, a gear 174, a pinion 176, a worm 178, a worm gear 180, a shaft 182, a pulley 184, a belt 186, a motor 188, a drive shaft 190, a gear 192, a pinion 194, a worm 196, a worm gear 198, a shaft 200, a pulley 202, a belt 204, a motor 206, a 634, a belt 636, a motor 638, a drive shaft 640, a gear 642, a pinion 644, a worm 646, a worm gear 648, a shaft 650, a pulley 652, a belt 654, a motor 656, a drive shaft 658, a gear 660, a pinion 662, a worm 664, a worm gear 666, a shaft 668, a pulley 670, a belt 672, a motor 674, a drive shaft 676, a gear 678, a pinion 680, a worm 682, a worm gear 684, a shaft 686, a pulley 688, a belt 690, a motor 692, a drive shaft 694, a gear 696, a pinion 698, a worm 700, a worm gear 702, a shaft 704, a pulley 706, a belt 708, a motor 710, a drive shaft 712, a gear 714, a pinion 716, a worm 718, a worm gear 720, a shaft 722, a pulley 724, a belt 726, a motor 728, a drive shaft 730, a gear 732, a pinion 734, a worm 736, a worm gear 738, a shaft 740, a pulley 742, a belt 744, a motor 746, a drive shaft 748, a gear 750, a pinion 752, a worm 754, a worm gear 756, a shaft 758, a pulley 760, a belt 762, a motor 764, a drive shaft 766, a gear 768, a pinion 770, a worm 772, a worm gear 774, a shaft 776, a pulley 778, a belt 780, a motor 782, a drive shaft 784, a gear 786, a pinion 788, a worm 790, a worm gear 792, a shaft 794, a pulley 796, a belt 798, a motor 800, a drive shaft 802, a gear 804, a pinion 806, a worm 808, a worm gear 810, a shaft 812, a pulley 814, a belt 816, a motor 818, a drive shaft 820, a gear 822, a pinion 824, a worm 826, a worm gear 828, a shaft 830, a pulley 832, a belt 834, a motor 836, a drive shaft 838, a gear 840, a pinion 842, a worm 844, a worm gear 846, a shaft 848, a pulley 850, a belt 852, a motor 854, a drive shaft 856, a gear 858, a pinion 860, a worm 862, a worm gear 864, a shaft 866, a pulley 868, a belt 870, a motor 872, a drive shaft 874, a gear 876, a pinion 878, a worm 880, a worm gear 882, a shaft 884, a pulley 886, a belt 888, a motor 890, a drive shaft 892, a gear 894, a pinion 896, a worm 898, a worm gear 900, a shaft 902, a pulley 904, a belt 906, a motor 908, a drive shaft 910, a gear 912, a pinion 914, a worm 916, a worm gear 918, a shaft 920, a pulley 922, a belt 924, a motor 926, a drive shaft 928, a gear 930, a pinion 932, a worm 934, a worm gear 936, a shaft 938, a pulley 940, a belt 942, a motor 944, a drive shaft 946, a gear 948, a pinion 950, a worm 952, a worm gear 954, a shaft 956, a pulley 958, a belt 960, a motor 962, a drive shaft 964, a gear 966, a pinion 968, a worm 970, a worm gear 972, a shaft 974, a pulley 976, a belt 978, a motor 980, a drive shaft 982, a gear 984, a pinion 986, a worm 988, a worm gear 990, a shaft 992, a pulley 994, a belt 996, a motor 998, a drive shaft 1000.

FIG. 1

File 2

FIG. 3

FIG. 4A is a perspective view of a mobile device 400 in an open position. The device 400 includes a top surface 402 and a bottom surface 404. The device 400 is shown in an open position, with the top surface 402 and the bottom surface 404 separated. The device 400 includes a hinge mechanism 406, 408, 410, 412, 414, 416, 418, 420, 421, 422, 432, 434, 436, 438, 439, 440, 442, 444, 446, 448, 450, 451, 452, 454, 456, 462, 464, 466, 468. The device 400 is shown in an open position, with the top surface 402 and the bottom surface 404 separated. The device 400 includes a hinge mechanism 406, 408, 410, 412, 414, 416, 418, 420, 421, 422, 432, 434, 436, 438, 439, 440, 442, 444, 446, 448, 450, 451, 452, 454, 456, 462, 464, 466, 468.

FIG 9A

FIG 9B

FIG 9C

FIG 9A: A cross-sectional view of a mechanical assembly. A central shaft (906) passes through a horizontal plate (930). The shaft has a tapered top (934) and a wider section (912) below the plate. The plate has a central hole (924) and a smaller hole (922) on the opposite side. A label 936 points to the top surface of the plate, and 932 points to the bottom surface. The shaft is surrounded by a sleeve (909) which is part of a larger housing (908). At the bottom, there is a circular component (907) with a small protrusion.

DECLARATION AND POWER OF ATTORNEY

As a below named inventor of the invention claimed in the attached application for United States Letters Patent, I hereby declare that:

INVENTORSHIP IDENTIFICATION

My residence, post office and citizenship are as stated at the end of this declaration next to my name; I believe I am the original first and sole inventor [if only one name is listed below] or an original, first and joint inventor [if plural names are listed below] of the invention which is claimed in the attached application entitled:

Height Adjustable Furniture Columns Including Actuation Mechanisms

ACKNOWLEDGMENT OF REVIEW OF PAPERS AND DUTY OF CANDOR

I have reviewed and understand the contents of the attached application, and acknowledge my duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulation, Section 1.56(a).

PRIORITY CLAIM

I hereby claim foreign priority benefits under Title 35, United States Code, Section 119 of any foreign application(s) for patent or inventor's certificate, or of any PCT international application(s) designating at least one country other than the United States of America, filed by me on the same subject matter as set forth in the attached application, namely:

I hereby claim the benefit under Title 35, United States Code, Section 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, Section 112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37 C.F.R. 1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application.

09/173,236 filed 10/15/98 entitled "Height Adjustable Chairs and Tables"

I hereby claim the benefit under Title 35, United States Code, Section 119E of any United States Provisional Patent application(s) listed below:

60/091,800 Aled 7/06/98 entitled "Height Adjustable Tables"
60/092,699 Aled 7/14/98 entitled "Tube Release Mechanism for
Gas or Hydrometallic Springs"

POWER OF ATTORNEY

As a named inventor, I hereby appoint the following attorneys or agents to prosecute this application and to transact all business in the United States Patent and Trademark Office connected therewith.

Jerry Johnson, Registration Number 35, 208

Address all telephone calls to: Jerry Johnson at telephone number 406-449-4022

Address all correspondence to: Jerry Johnson 715 N. Ewing St. Helena MT 59601

DECLARATION

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements are made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.
